A REVIEW ON RECALCITRANT ENDODONTIC INFECTIONS; FROM MICROBIOLOGICAL CONCERNS TO MANAGEMENT STRATEGIES

One of the most frequent reasons for persistent post-endodontic infections is colonization of therapy-resistant microorganisms. Therefore, in order to gain successful results following orthograde endodontic (re-)treatments, a thorough knowledge about the characteristics of and therapeutic strategies against the above mentioned microorganisms will be mandatory for the clinicians. In this study, efforts have been done to obtain updated evidence about bacteriologic composition of these infections as well as the most recent management protocols.
