Examiner, 2012

EXTRACTION-REPLANTATION: AN ALTERNATIVE SURGICAL TECHNIQUE

There are instances when a patient desires to save a previously treated tooth, but conventional surgery is impractical. The technique of extracting such a tooth, correcting the problem, and replacing it in the socket will be investigated and described in detail. In addition, the speaker will discuss the various materials available to repair the tooth either apically or laterally, and the evidence based literature that is involved in the decisions being made.
